Giydirme cephe sistemleri temel olarak binanın dış kabuğu ile sistemin dış yüzeyi arasında bir boşluk bırakma esasına dayanır ve özellikle termo - akustik yalıtım konularında etkili olup çeşitli fonksiyonel avantajlar sunar. Giydirme sistemi yeni binaların cephelerinde olduğu kadar eski binaların da cephelerinde, cephenin bütün fiziksel yapı ve tasarım gerekliliklerini karşılayan bir sistemdir.

Surface cladding systems by leaving a gap between the wall and porcelain tile provide effective thermal and acoustic insulation and offer plenty of functional advantages. The system can be applied to old buildings as well as new ones.

Binaya dışarıdan gelebilecek güneş, yağış ya da rüzgar etkileri sistemin dış yüzeyi tarafından engellenip boşluktaki hava hareketi tarafından uzaklaştırılır.

The impact of sunlight, rain, wind etc is blocked by the external surface of the system and removed by the air circulation in the void.

Sistemin dış yüzeyi ile binanın dış kabuğu arasında kalan hava boşluğu her türlü hava hareketine imkan vererek çeşitli açılardan binayı ve kullanıcıyı rahatlatır.

The void between the external wall of the building and the cladding allows air circulation which improves the comfort with in the building.

Dışarıdan etkiyen ısının bir bölümü sistemin dış yüzeyi, bir bölümü hava boşluğu bir bölümü de içeriden dışarıya doğru oluşan ısı kaçışı ile birlikte ısı yalıtımı tarafından engellenerek iç iklimlendirmede azami konfor ve enerji tasarrufu sağlanır. Dolayısıyla hem kullanım maliyetlerine hem de çevrenin korunmasına katkıda bulunur.

It reduces heat loss from the exterior, giving maximum internal comfort and energy saving in air conditioning. In reducing heat loss to the outside it also protects the environment.

Sistem ısı yalıtımını sağlarken aynı zamanda binanın nefes almasına imkan sağlar.

Not only does the system provide thermal isolation, but also it assists the respiration of the building.

Bina dış kabuğundan ve ısı yalıtımından geçen nem herhangi bir yoğunlaşmaya uğramadan hava boşluğuna ulaşır ve ortamda oluşan vantilasyon sayesinde hemen uzaklaştırılır.

Moisture which escapes through the external wall of the building does not condense but is dissipated by the air flow in the void.
